Prof Dr Marko Robnik-Šikonja

Natural language processing, Edition 2023

Contents

- Dense embeddings
- LSA embedding
- (Neural dense embeddings are covered later)

Dense vector embeddings

- advantages compared to sparse embeddings:
 - less dimensions, less space
 - easier input for ML methods
 - potential generalization and noise reduction
 - potentially captures synonymy, e.g., road and highway are different dimensions in BOW
- the most popular approaches
 - matrix based transformations to reduce dimensionality (SVD or LSA)
 - we will cover the following ones later:
 - Brown clustering
 - neural embeddings (word2vec, Glove)
 - contextual neural embeddings (ELMo, BERT)

Meaning focused on similarity

- Each word = a vector
- Similar words are "nearby in space"

Dense Word Embeddings

- Word embeddings store semantic and syntactic information
- Word embeddings are currently the standard way to go with natural language processing

Male-Female

Verb tense

Country-Capital

Idea of LSA – Latent Semantic Analysis

- decomposition of word-context matrix with SVD
- approximation with the most important dimensions

Word-word matrix (or "term-context matrix")

- Two **words** are similar in meaning if their context vectors are similar.

sugar, a sliced lemon, a tablespoonful of their enjoyment. Cautiously she sampled her first well suited to programming on the digital for the purpose of gathering data and **apricot** **pineapple** **computer.** **information** jam, a pinch each of, and another fruit whose taste she likened In finding the optimal R-stage policy from necessary for the study authorized in the

	aardvark	computer	data	pinch	result	sugar	...
apricot	0	0	0	1	0	1	
pineapple	0	0	0	1	0	1	
digital	0	2	1	0	1	0	
information	0	1	6	0	4	0	

SVD for matrices

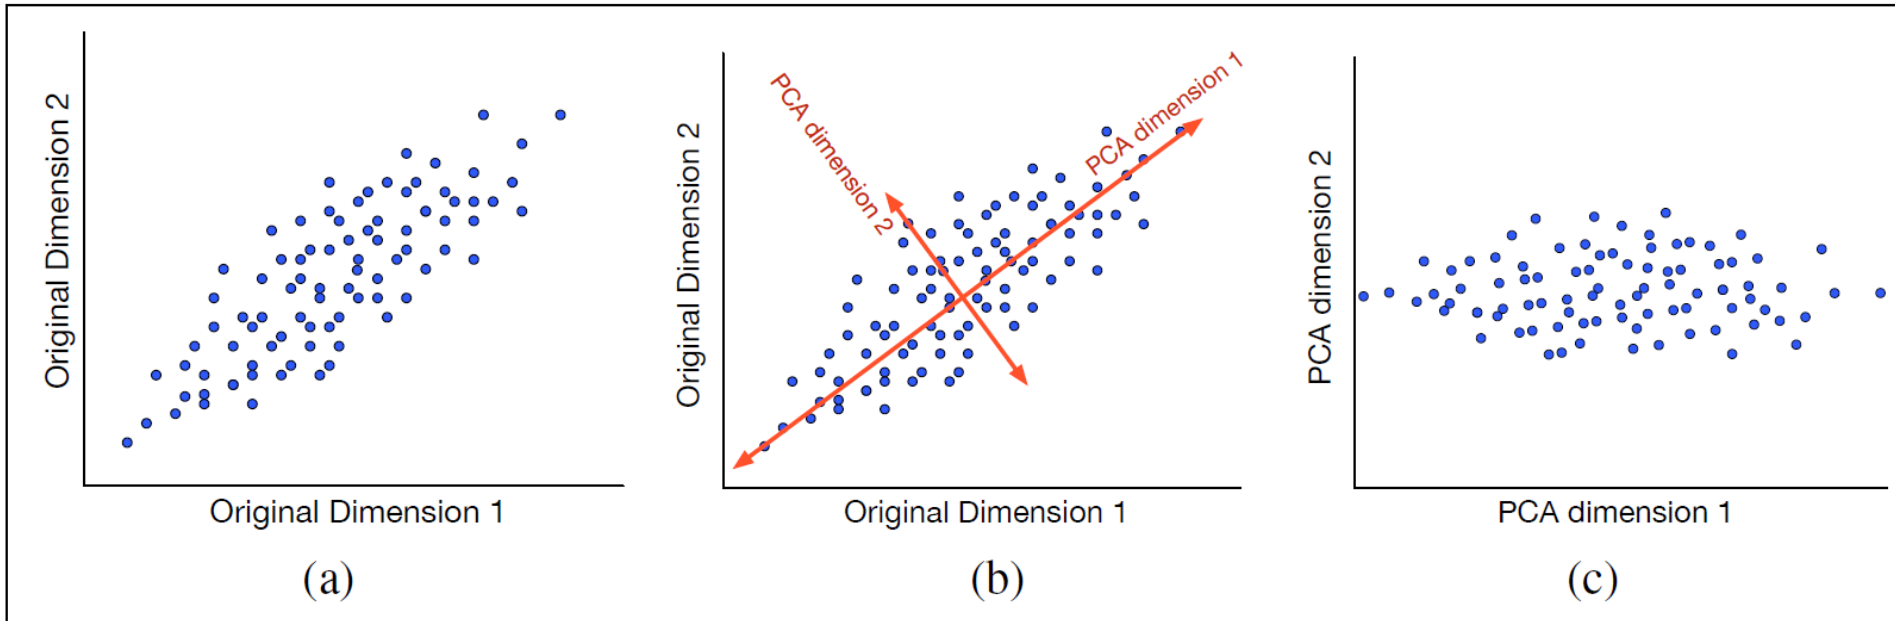

- SVD (singular value decomposition) for arbitrary matrices, generalizes decomposition of eigenvalues

$$M = U\Sigma V^T$$

- approximation of N-dimensional space with lower dimensional space (similarly to PCA)
- in ML used for feature extraction
- a rotation in the direction of the largest variance

Principal components analysis

- principal components analysis, PCA
- we iteratively find the orthogonal axes of the largest variance
- we use the new dimensions to approximate the original space

Latent semantic analysis

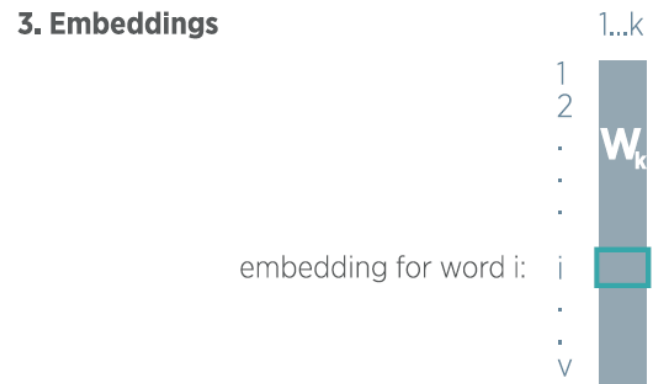

- latent semantic analysis (LSA), also latent semantic indexing (LSI)
- uses SVD on the term-document matrix X of dimension $|V| \times c$, where V is a vocabulary and c the number of documents (contexts)
- $X = W\Sigma C^T$, where
 - W is a matrix of dimension $|V| \times m$; rows represent words and columns are dimensions in new latent m -dimensional space
 - Σ is diagonal matrix of dimension $m \times m$ with singular values on diagonal
 - C^T is a matrix of dimension $m \times c$, where columns are documents/context in a new m dimensional latent space
- we approximate m original dimensions with the most important k dimensions
- matrix W_k of dimension $|V| \times k$ represents embedding of words in lower k - dimensional space

Diagram of LSA

$$\begin{bmatrix} X \\ |V| \times c \end{bmatrix} = \begin{bmatrix} W \\ |V| \times m \end{bmatrix} \begin{bmatrix} \sigma_1 & 0 & 0 & \dots & 0 \\ 0 & \sigma_2 & 0 & \dots & 0 \\ 0 & 0 & \sigma_3 & \dots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \dots & \sigma_m \end{bmatrix} \begin{bmatrix} C \\ m \times c \end{bmatrix}$$

$$\begin{bmatrix} X \\ |V| \times c \end{bmatrix} = \begin{bmatrix} W_k \\ |V| \times k \end{bmatrix} \begin{bmatrix} \sigma_1 & 0 & 0 & \dots & 0 \\ 0 & \sigma_2 & 0 & \dots & 0 \\ 0 & 0 & \sigma_3 & \dots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \dots & \sigma_k \end{bmatrix} \begin{bmatrix} C \\ k \times c \end{bmatrix}$$

SVD for embeddings

LSA parameters

- usually $k=300$ or $k=500$
- weighting with local and global weights
- local weight of each word i is log of its frequency in document j :
 $1 + \log f(i, j)$
- global weight of each word is a variant of entropy, where n_{docs} is the number of documents

$$1 + \frac{\sum_j p(i, j) \log p(i, j)}{\log n_{\text{docs}}}$$

Dense embeddings

Dense. Dim = 200 (for example)

```
In [67]: print(vec['banana'])  
plt.plot(vec['banana'])
